Assistant Professor of Education

Third Reader: Charles E. Stratton
Professor of Science and Mathematics
ACKNOWLEDGMENT

The cooperation of a number of individuals has made it possible to carry out this investigation to a successful conclusion. The generosity and willingness shown by these individuals is sincerely appreciated. The valuable suggestions and criticism furnished by the group of teachers who were members of the Seminar in Science Education, Boston University, 1946-1947, is gratefully acknowledged.

The writer is indebted to Professor Vaden W. Miles, for his encouragement in this study. Sincere thanks are due to Professor John G. Read for the valuable suggestions and hints in the preparation of this work. Finally, the writer is deeply obligated to Miss Genevieve E. Brudzynski for her encouragement and help throughout this study.

CHAPTER I
SURVEY OF RELATED LITERATURE

Introduction

Everywhere we look we find an abundance of applications of scientific principles. Technological advances in means of communication, transportation, and in production during the last two decades have greatly affected man's way of living. During World War II use of atomic bombs, of jet propelled aircraft, of radar, and of medical discoveries have made man realize more than ever before the great part science plays in his very existence.

In order that growing children may have a better understanding and appreciation of those things about them which involve scientific principles, courses in science in all our schools should be more meaningful and beneficial.

In recent years the trend has been to construct courses of study in science at both the junior and senior high-school levels around the needs of the pupils. Teachers have been faced with the problem of how to teach funds of current information intended to be used only when the needs arise. Teachers have likewise been confronted with the problem of building up in those pupils the capacity
METHODS

Introduction

The purpose of this work is to examine the problem of the process of the formation and soundness of principles of educational administration, as affected by the ways of carrying out these principles. The study of the problem may be divided into two parts: the theoretical and the practical. The theoretical part deals with the principles of educational administration and their relation to the practical part, which deals with the methods of carrying out these principles. The study of the problem is divided into two parts: the theoretical and the practical. The theoretical part deals with the principles of educational administration and their relation to the practical part, which deals with the methods of carrying out these principles.
of determining their own needs for specific information and the understanding of where to get and how to apply that information.

In the report of the Commission on Secondary School Curriculum\(^1\) five major needs of adolescent in the area of personal living are given. The needs for personal health, for self assurance, for a satisfying world picture and a workable philosophy of life, for a range of personal interests, and for esthetic satisfaction\(^2\) are recommended to be used in setting up science course objectives. This commission further reports that not only should needs be met, but they should be met in such ways as to contribute to the progressive construction and refinement of the democratic way of life.\(^3\)

Many surveys and research studies have been conducted in the past few years to set up a pattern which could be used as a guide for all types of courses of instruction. In the field of science education such surveys and research studies have not been as numerous as in other fields in spite of the evergrowing impor-

In the report of the Commissioner of Education, the
Commissioner brings to the attention of the
State Board of Education the need for
additional personnel in the field of
educational administration. The needs for
personnel are indicated for a variety of
positions in various areas of education.

Some of these needs are for administrative
personnel, while others are for
instructional personnel. The
Commissioner recommends that
additional personnel be
appointed to meet the needs of
the educational system.

With an emphasis on the importance of
administration, the Commissioner
indicates the need for additional
administrative personnel in the
educational system. The
Commissioner suggests that

educational system.
tance of its subject matter.

Wilbur L. Beauchamp in his study indicated that there is no set formula for setting up and evaluating objectives in science teaching. He did, however, point out that the trends he found should be carefully considered by those who are continually attempting to improve their courses in secondary school sciences. Beauchamp found that since 1925 there have been revisions of 58 courses in general science, 45 courses in biology, 30 courses in chemistry, and 27 courses in physics. These findings can be viewed as the beginning of a new era in science teaching.

The National Society for the Study of Education reported in 1932 that courses of instruction in physics and chemistry were dominated by college preparatory ideas. It further reports that "ideas of mastery of subject matter of the field as such and the disciplinary value of the subject expressed in terms of training in scientific method have governed

---

the thinking of teachers of chemistry and physics."\(^6\) This report advocates the teaching of principles and generalizations as objectives. Classroom experiences must be provided to satisfy the aims of general education. "The major generalizations and associated scientific attitudes are seen as of such importance that understanding of them are made the objectives of science teaching".\(^7\)

The Thayer Commission of the Progressive Education Association and the Thirty-First Yearbook Committee have greatly influenced science teachers to reorganize their courses around generalizations and principles. The Thayer Commission has also pointed out that the education of an individual is due to the effect on his whole behavior that has come from the experiences in which he has participated.\(^8\)

Craig\(^9\) postulated the following three criteria for the selection of objectives:

1. Certain objectives that are selected for elementary-school science should conform to those scientific conceptions (1) which

understood greatly influence the thought reaction of the individual; (2) which have modified thinking in many fields.

2. Certain objectives that are selected for elementary-school science should conform to those goals (information, skills, and habits) in science that are important because of their function in establishing health, economy, and safety in private and public life.

3. Certain objectives that are selected for elementary-school science should conform to those facts, principles, generalizations, and hypotheses of science which are essential to the interpretation of natural phenomena which commonly challenge children.

"The principles and generalizations of science must, therefore, occupy considerable place in a program of general education, the aim of which is life enrichment."\(^{10}\)

For the past fifteen years many research studies have been made in an attempt to bring about an accepted standard for all forms of instruction. In the field of science education, a few important surveys which have been recently conducted clearly indicate that there is a need for adoption of scientific principles and generalizations as objectives for courses in science.

SURVEY OF IMPORTANT RESEARCH STUDIES PERTAINING TO THE DETERMINATION OF PRINCIPLES AS OBJECTIVES OF SCIENCE TEACHING

The Fifth Yearbook of the Department of Super-

---

\(^{10}\) A Program for Teaching Science, op. cit., p. 43.
intendence of the National Education Association\textsuperscript{11} advocated that the design and make-up of a course in science should be such that it enables the students to have experiences with the attainment of knowledge of scientific principles that are worthwhile from both a social and practical standpoint. The course should have provisions to allow for adequate drill in the application of life situations.

In the planning and organizing of a science course of study for the elementary grades, Craig\textsuperscript{12} says that the teacher should not be concerned to any great extent with the training of children to become scientists, but rather the teacher should be deeply concerned with guiding pupils to become intelligent and law-abiding citizens. The understanding of phenomena which so often challenge and interest so many pupils can be accomplished by setting up objectives for a course in science that agree with the facts, principles, generalizations, and hypotheses of science.

The Juvenile Delinquency Achievement Program
Research, Board of Regents, New York State, 1962.
Hackett\textsuperscript{13} analyzed twelve textbooks in biology to find the amount of space that writers devote to the discussion of biological principles and their applications to problematic situations. The analysis showed that the amount of space devoted to such discussions ranged from forty-eight to twenty-three percent. The larger portion of the book in every case was factual and descriptive.

A study by Menzies\textsuperscript{14} showed that in twelve college biology textbooks a range of 87 to 97.6 percent of the space available was devoted to principles and applications. The study further shows that little attention is given to the application of principles to problematic situations.

Heinemann\textsuperscript{15}, in her study of principles in general science textbooks, discloses that principles in general science were given little consideration. Only ninety-three principles were

found in twenty books analyzed. Heinemann further
discloses that there is very little agreement
among authors of textbooks as to which scientific
principles are important in general science. She
recommends that teachers should base their teaching on
a small number of principles with many application in-
stead of placing emphasis on a large number of prin-
ciples with few applications. In her definition of a
science principle Heinemann states, "a principle is a
statement of relationship frequently causal in nature
between two facts."\textsuperscript{16}

In 1931 Wilbur\textsuperscript{17} analyzed fourteen textbooks of
general science used in the ninth grade. The defini-
tion of a principle and the criteria for the selection
of principles that Wilbur used were the same as those
Martin\textsuperscript{18} used in his study. The following criteria\textsuperscript{19}

were used by both Wilbur and Martin:

1. It must be a comprehensive generalization which resumes the widest possible range of facts within the domain of facts with which it is directly concerned. The facts resumed in the generalization must denote:
   a. Objects and/or events and the relation between them.
   b. Properties.

2. It must be scientifically true. To satisfy a criterion:
   a. It must be verifiable; i.e., it must be stated so that it suggests, directly or indirectly, a definite operation of observations or experiments whereby its truth value can be tested or verified.
   b. It must be consistent with the body of accepted scientific knowledge, and except for a few limiting or singular exceptions, with all the data (facts) relevant to it.

Wilbur tabulated the principles and submitted them to subject-matter specialists in biology, chemistry, geology, and physics for validation in terms of the criteria and for revision of inaccurate and unsatisfactory statements. After the principles were returned from the specialists they were then given to ten teachers of science who were requested to indicate which of these are necessary, or undesirable in a course of general science. It was found that from all fourteen textbooks only eighteen of the 170 principles were given, even in part, in principle form, in more than half of the textbooks analyzed. The ten instructors who
With careful consideration of the principles and implications of the data and theoretical framework, it is apparent that certain aspects and principles deserve attention in the development of the research. This section aims to outline the attributes and features of the system that we propose to study. From these attributes, we can analyze and conclude that the system is dynamic and complex. It may be necessary to consider new and innovative methods to understand its behavior and characteristics. If we assume that these attributes and principles are valid, we may learn from the current literature and apply them in our study. The theoretical framework and the proposed model are based on these assumptions and will be further developed and refined in subsequent sections.
evaluated them felt that only five of the eighteen principles were necessary.\footnote{20}

Lucas\footnote{21} made an analysis of current chemistry textbooks for secondary schools. He found that the space in those books given to principles and problems involving their application is thirty per cent.

In Koppenaal's analysis\footnote{22} of current physics books, a similar study to that of Lucas, it is shown that the more recent textbooks devote about 28 per cent of the total word space available to discussion of principles and of problematic situations demanding their applications. The largest number of principles discussed in any one textbook is forty-three and the total number of principles given in the textbooks analyzed was about sixty.

Robertson\footnote{23} conducted an investigation to

\footnote{20} Wilbur, op. cit., p. 47.

determine the principles of science suitable as goals of instruction in the elementary grades. A list of major and minor principles of science was developed from ten research studies that had been previously made. After the list was compiled it was submitted to a group of twenty experts in the field of science for evaluation as to the suitability of the principles to be included in an elementary science course of instruction. A list of 243 principles was reduced to 113 after the experts evaluated them.

At the University of Chicago, investigations were made under the direction of Downing to find what principles are most needed in the solution of everyday problems. These investigations were also made to determine the order of importance of principles. From these, Downing made up a total list of 96 principles necessary in chemistry, physics, and biology and gave their relative order of importance.

---

acquire the principles of science suitable to the

Scope, of 20-45. 0fficial, Writings, of Chicago.

1930, 1931.
While at Columbia University in 1935, Pruitt\textsuperscript{25} conducted an investigation in the field of chemistry. He listed those generalizations and concepts which have the most value to man in his interpretation of his environment. As part of his investigation Pruitt analyzed three college-entrance examinations; one year's issues of the Atlantic Monthly, The Forum, and Harper's Magazine; about 50,000 pages of material in five books of sociology; 12 issues each of Popular Science Monthly, Scientific American, and Science News Letter; copies of eight well-known newspapers for an entire year; and finally, sixty-five textbooks in the various science fields. With the aid of the same criteria for developing a principle which Robertson used in his study, 135 chemical concepts and generalizations were formulated and were arranged in the approximate order of their importance.

Martin\textsuperscript{26} in his chronological survey of research studies of principles as objectives in a

course of instruction in science reported 29 research studies. He gives a description of 18 studies. Included in these, however, were 11 contributing studies making the total of 29. Martin's own study in the determination of the principles of the biological sciences, brought the total up to 30.

Martin divided his study into two phases, namely, the inductive and the deductive. The purpose of the inductive phase was to obtain a tentative list of the important principles of the biological sciences while the purpose of the deductive phase was to determine only those principles of his master list which are of importance as objectives in science program taught for general education. In the analysis, three junior-college textbooks, three high-school textbooks, a survey series of biological sciences for the general reader, and reports of five research studies which satisfied the criteria were used. A list of statements was made up and then checked by three specialists in biology. After the list was returned from the specialists it consisted of 300 major principles and 236 minor principles.

The question of how to apply and adapt the principles of the Nuremberg trials to the current situation has been a matter of debate among legal experts.

In the aftermath of the trials, there was a significant effort to ensure that similar violations of human rights would not be tolerated in future conflicts.

Some argue that the trials were necessary to establish a precedent for international law, while others believe that the outcomes were too lenient and that more serious offenses were not adequately punished.

The trials and their outcomes serve as a reminder of the importance of upholding international law and the protection of human rights.
At the University of Michigan in 1941 Wise conducted a study to determine what principles of the physical sciences are most important for general education. The first step of this study consisted in making up a tentative list of principles. The second step was determining the relative importance of principles by frequency of their applications in the solution of problems that are encountered in general living. The evaluation of the results of contributing studies by Craig, Curtis, Davis, Heiss, Muller, Nelson, Newland, Partridge, Robertson, and Weiser was the third step. The final step was a synthesis of the results of the contributing studies.

The criteria that Wise used in the study to determine a principles were:

1. To be a principles a statement must be a comprehensive generalization describing some fundamental process, constant mode of behavior, or property relating to natural phenomena.

---

29 Ibid., p. 371.
Do you believe in the existence of a higher power? What are your thoughts on this topic?
2. It must be true without exception within limitations specifically stated.
3. It must be capable of illustration.
4. It must not be a definition.

In his final results, Wise gave a list of 264 principles of physical science in their relative order of importance. The highest ranking half of the principles included 108 principles of physics, 28 principles of chemistry, and 6 principles of geology.

In four communities of Massachusetts, Fleish conducted a survey in grades VII through XII to determine those principles which should be used as objectives in the teaching of general-science courses. After making up a list of sixty principles based on questions submitted by pupils, Fleish analyzed ten general-science textbooks to determine how much space the authors devote to the sixty principles. Although many textbooks did include a large number of her principles, the authors did not state them in clear and concise language.

At the University of Michigan in 1946 Jones

The text is not legible due to the quality of the image.
carried on an investigation to determine the principles of science found in seven ninth-grade textbooks in general science. The conclusion drawn by Jones was that there is very little, if any, agreement on the number and selection of scientific principles included in the seven textbooks she analyzed.

Keeslar\textsuperscript{32} carried on an investigation to find out the extent to which instructional films in science education contribute to objectives of general education. In the selected films, made for instruction in science, he found that little effort is made to teach scientific principles, scientific method, or scientific attitudes.

In his doctoral dissertation, Blanchet\textsuperscript{33} used the physical science principles prepared by Wise and the biological science principles prepared by Martin for assigning subject-matter topics to principles. Blanchet's criteria for a principle, therefore, were the same as the work of both Wise and Martin.

\textsuperscript{33}Waldo Emerson Blanchet, "A Basis for the Selection of Course Content for Survey Courses in the Natural Sciences." Unpublished Doctor's dissertation, University of Michigan, 1946.
Blanchet's work was divided into four major parts. The first part consisted in determining the principles of science most suitable as goals for survey courses in the natural sciences at the junior-college level. In the second part he set out to determine the extent to which the principles are included in textbooks published for use in survey courses in the natural sciences. The third part consisted of determining the subject-matter topics found in textbooks for use in the natural sciences, as a source of informational materials with which to develop understanding of the principles. Finally, in his fourth part he determined student opinion concerning the relative values of topics which they had studied in survey courses in the natural sciences.

With the co-operation of specialists in the teaching of sciences and of college teachers of science he was able to accomplish his first part. The principles of science most suitable as goals for survey courses were chosen on the basis of the combined judgement of these individuals.

To carry out the second part of his investigation it was necessary to set up a group of

\(^{34}\text{Ibid.}, \ p. \ 35.\)
In order to provide sound educational experiences and opportunities for students, it is essential to ensure that the necessary resources are available. The provision of proper facilities and materials is crucial for effective learning. Teachers and administrators must work together to create an environment that fosters growth and development. This includes not only the physical aspects of the school, such as classrooms and laboratories, but also the emotional and social support systems that help students thrive. By focusing on these aspects, we can create a positive and inclusive atmosphere that prepares students for success in all areas of their lives.

To achieve this, it is important to invest in resources that support learning. This may include technology, books, and other materials that help students explore and expand their knowledge. Additionally, it is crucial to provide professional development opportunities for teachers, so they can continue to grow and improve their teaching practices. This will ultimately benefit students by ensuring that they receive the best possible education.

In conclusion, providing quality education requires a commitment from all stakeholders. By working together, we can create a system that prepares students for success and empowers them to reach their full potential.
criteria for selecting principles from the textbooks. The methods which the various authors used in giving principles varied widely. Consequently, Blanchet used the following criteria to decide whether statements were of a particular principle or not:

1. If it expressed completely the idea in the original statement of the principle.
2. If, though it did not state all of the elements of the principle, it was referred to by the author or authors as being the said principle.
3. If it unmistakeably implied the principle and could be reworded so that the principle was stated.
4. If, though it did not state the principle in full, it could be combined justifiably with another statement in the same paragraph or section, which together stated the principle or could be reworded to do so.

In the preparation of the composite topical outline of the third part of his work, Blanchet submitted outlines to three specialists in the teaching of science. These specialists examined the outlines critically to determine if the position of each topic in each outline was defensible. Secondly, these outlines were checked so as to be free from repetition and duplication. In the last step of this third part the frequency of the topics of the composite outline was determined.
The fourth and last part of this extensive investigation consisted of assigning a selected sampling of the topics of the composite outline to those principles of science which are very important goals of instruction in survey courses in science. Copies of the composite outline and the assigned principles were submitted to three specialists in the teaching of science to check the defensibility of the assignments of principles to the topics. The results of this fourth part of the investigation show that Wise's 272 physical principle were assigned to 1171 topics while Martin's 300 principles of the biological sciences were assigned to a total of 970 topics. The conclusion Blanchet drew from this fourth part was that there exists a wide diversity in material-content in science textbooks and that although diversified, there exists suitable materials for teaching of the understanding of the principles of the natural sciences.

SURVEY OF LITERATURE PERTAINING TO THE DETERMINATION OF THE EFFECTIVENESS OF PRINCIPLES IN TERMS OF RETENTION OF LEARNING

In three Ohio High Schools, Frutchey

The company has placed a select group of qualified investigators on the case to undertake a complete and comprehensive investigation of the circumstances surrounding the incident. The company has taken all necessary precautions to ensure that the investigation is conducted fairly and objectively. The company is committed to ensuring that justice is served and that all parties involved are treated fairly. The company has established a number of procedures to ensure that the investigation is conducted in a transparent and accountable manner.
ducted experiments to determine if principles are retained longer than facts. Five pre-tests were given to measure certain knowledge, abilities, and skills in chemistry. Another test was given nine months later to ascertain the gains. A year after the course had been completed still another test was given to measure the retention of the subject matter covered in the course.

The results of this experiment show that factual material is not retained as long as are principles. In the application of principles, both boys and girls retained the same percentages of their progress made in the course.

At Ohio University Tyler\textsuperscript{36} found that factual material is forgotten most quickly. In the results of zoology course examinations, it was learned that material of general information is more permanent. The ability to apply zoological principles to entirely new situations during a fifteen month period is not seriously lost by students. In his conclusion, Tyler recommends that examinations which are developed by college

teachers should be built around materials which have more permanent value in college education.

Zeigler in his study of general science, showed that only those principles which students meet and encounter in their daily life situations are retained. Although science knowledge is practical and useful as well as valuable, he concludes that there is too much emphasis placed on facts which will be forgotten in a short time.

In a survey which Johnson carried out to learn the extent of pupil's retention of information connected with botany, it was found that those students who have the most botanical information at the time of completing the course are likely to retain more after periods of fifteen and twenty-seven months than students with less botanical information. The rate of loss in the ability to retain the learned information was very rapid during the period between three and fifteen months after completion of the course. After the fifteen months, the loss in retention showed a gradual decline.

In a neutral medium, a 0.5% solution of hydrogen peroxide can be used to prepare the solution. The solution can be applied to the area of interest, as well as applied to the wound. The solution will also work for many other substances, such as plastic, cloth, and metal.
Wert\textsuperscript{39}, in an investigation on the retention of course growth, shows that the loss of retention is greater with information which is less specific. With the lapsing of time, students show some gain in the ability to apply principles of zoology to new situations.

Using the findings of Frutchey, Tyler, Johnson and others as a basis for a study, Reek\textsuperscript{40} found that from the standpoint of retention of learning, it is very important to teach science principles and that unrelated factual material is highly unsatisfactory if retention is to be considered as an important factor.

SUMMARY OF RESEARCH STUDIES

A review of the foregoing surveys and investigations definitely points to the fact that scientific principles and generalizations are justifiably recognized as objectives of science instruction for general education.

Frutchey, Zeigler, Johnson, Wert, and Tyler all give evidence that the teaching of fac-

\textsuperscript{40} Doris Lucille Reek, "A Study of the principles of Science in Four Series of Textbook of Elementary Science." Unpublished Master's thesis, University of Michigan, 1943.
SUMMARY OF RESEARCH STUDIES

A review of the literature suggests that:

- Electroplating generally produces more reactive and cost-effective results than alternative methods of depositing gold or silver onto metal
- Silver is a better conductor than gold and may be preferable for certain applications

The following conclusions are drawn:

- Further investigation is required to confirm these findings.
tual material is no longer justified as an end in itself.

Reports of the Thayer Commission and the Thirty-First Yearbook, along with the research studies conducted at Columbia University, New York University, University of Minnesota, Ohio State University, University of Chicago, and the University of Michigan, justify the developing of functional understanding of scientific principles as a major objective of science teaching.

The investigations conducted by Martin and Wise have made valuable contributions in the statement of scientific principles. They did not attempt, however, to determine principles suitable for various grade levels.

PROBLEM OF THE INVESTIGATION

The purpose of this investigation is to determine what principles of physical science are found in four textbooks of physics at the senior-high school level published or revised since 1942. Criteria for choosing statements of principles were established by fifteen teachers in a Seminar in Science Education, Boston University, 1946-47.
STATEMENT OF THE PROBLEM

The problem of this investigation is to select from four textbooks of physics for the senior high-school level, statements which can be justifiably assigned to the principles of physical science compiled by Wise.

SCOPE AND LIMITATION OF THIS INVESTIGATION

This investigation is limited to the analysis of four textbooks of physics written specifically for the senior high school and with a copyright date of 1942 or later.

Wise's list of 272 physical principles will be used in the assignment of statements to the principles. Only those principles will be selected that appear to the investigator to conform to the criteria established for this investigation even though the possibility exists that there may be other principles suitable as goals of physics instruction at the senior high school.

CHAPTER II

THE INVESTIGATION

RESTATEMENT OF THE PROBLEM

The problem of this investigation is to select from four textbooks of physics for the senior high-school level, statements of principles which can be justifiably assigned to the principles of physical science compiled by Wise.

TECHNIQUES EMPLOYED

Selection of Textbooks for Analysis

For the purpose of this investigation the following criteria were adopted by a group of fifteen science teachers in a Seminar in Science Education at Boston University, 1946-47, and used as the basis for the selection of high-school textbooks analyzed:

1. Must be available for use at the time the study is started.
2. Must have been published by a reputable publishing house.
3. Must have been published or revised since 1942.
4. Must be representative of textbooks of physics used in high schools.

Four books which met the above criteria are:

Criteria for a Principle as Found in Textbooks of High-School Physics

Wise\(^1\) in his doctoral dissertation written in 1941, gave a list of 264 principles of physical science in their relative order of importance for the purpose of general education for grades I-XIV inclusive. Eight additional principles were not included in the list because they did not adequately meet the criteria established.

Since Wise's extensive study included a comprehensive list of physical principles which were determined by defensible research techniques, this investigator feels that the list is the best available. This investigation, therefore, is based on the same scientific principles or generalizations that Wise listed.

The meaning of the code

Heneman, who established
the University of Michigan developed four criteria which he used in the selection of statements of principles from textbooks intended for use at the junior-college level. At the high-school level, however, Blanchet's criteria were found to be inadequate. Because principles are usually introduced in simple form at the lower grade levels and then developed more and more through the junior-college, it seems reasonable to assume that some statements can be justifiably assigned to senior high-school level while at the junior-college the statement might fall short of meeting all the requirements. For this reason, it was found necessary to establish a new set of criteria to be used for this investigation.

The fifteen teachers of science in the 1946-1947 Seminar in Science Education at Boston University saw fit to modify Wise's criteria so that they could be used in the selection of statements of principles at the senior high-school level. The modified criteria were as follows:

A statement is considered to be that of a particular principle:
1. If it expresses completely the idea embodied in the original statement of the principle in Wise's list; or
As the national and international developments came to
bear on the need to improve the educational system of the
town, it was found that there was a need for a new level of
education. This level would not only provide a better
equilibrium of the different social groups but also
promote a better understanding of the national
problems. The national level would entail a more
accurate view of the world's affairs and a better
understanding of the issues facing the town.

The international community also
realized the importance of the new
level of education. They saw it as a
way to promote peace and
development.

The national level was
also seen as a way to
promote a better
understanding of
the different
social groups.

In conclusion, the
new level of
education was
viewed as a
necessary step
for the
development of
the town.
2. If, though it does not state all of the elements of the principle, it is implied by the author or authors as being the said principle; or
3. If it unmistakably implies the principle and can be reworded so that the principle is stated; or
4. If, though it does not state the principle in full, it can be combined justifiably with another statement in the same paragraph or section, which, if together state the principle.

Method of Analysis of Textbooks for Principles

The first step of this investigation consisted of analyzing the tables of contents of each book studied. It was found that a reasonable degree of similarity existed.

Book 1 had:

Unit I Matter and Molecules
Unit II Behavior of Fluids
Unit III Mechanics of Solids
Unit IV Heat
Unit V Sound
Unit VI Light
Unit VII Magnetism and Electricity
Unit VIII Land and Air Travel

Book 2 had:

Unit I What You Should Know about Matter
Unit II What You Should Know about Forces
Unit III What You Should Know about Heat
Unit IV What You Should Know about Sound
Unit V What You Should Know about Light
Unit VI What You Should Know about Magnetism and Electricity

Book 3 had:

Unit I The Properties of Fluids
Unit II The Laws of Force and Motion
<table>
<thead>
<tr>
<th>Unit</th>
<th>Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>III</td>
<td>Work and Heat</td>
</tr>
<tr>
<td>IV</td>
<td>Electricity and Magnetism</td>
</tr>
<tr>
<td>V</td>
<td>Wave Motion and Sound</td>
</tr>
<tr>
<td>VI</td>
<td>Light</td>
</tr>
<tr>
<td>VII</td>
<td>Electronics and Invisible Radiation</td>
</tr>
</tbody>
</table>

**Book 4 had:**

<table>
<thead>
<tr>
<th>Unit</th>
<th>Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Mechanics and Properties of Matter</td>
</tr>
<tr>
<td>II</td>
<td>Heat</td>
</tr>
<tr>
<td>III</td>
<td>Magnetism and Electricity</td>
</tr>
<tr>
<td>IV</td>
<td>Wave in Matter; Sound</td>
</tr>
<tr>
<td>V</td>
<td>Light Waves</td>
</tr>
<tr>
<td>VI</td>
<td>Electrical Emissions and Waves; Atomic Transformations</td>
</tr>
</tbody>
</table>

Because of the similarity of units in each of the four books, Wise's principles were grouped under seven topical headings:

1. Matter and Molecules
2. Mechanics of Fluids and Solids
3. Sound
4. Light
5. Heat
6. Magnetism and Electricity
7. Atoms, Atomic Transformations and Electrical Emissions

The principles were then written on a three by five inch card and placed under proper topical headings. In order to facilitate the handling of the cards, seven pockets, were made of thin cardboard and pasted in seven different places on the inside of a two-flap file folder $8\frac{1}{2}'' \times 11''$. In these pockets were placed each group of cards with the principles written on them.

After this preliminary work was completed the task of analyzing each book page by page was

Senses of the Sensation of Milk to the

ease of analytical was not done if these were
undertaken. When a statement of a principle which
met the criteria established was found it was first
underlined in the textbook. The book and page numbers
were then recorded on three by five inch file cards.
This procedure was continued until all four books
were completely analyzed.

Coefficient of Reliability for the Selection
of Principles from the Textbooks

Because of the wide variations in human
judgement, the investigator determined the "coeffi-
cient of reliability" in the selection of prin-
ciples from textbooks. Two months after the first
analysis one hundred pages selected at random from
one of the textbooks were rechecked for principles.

The randomly selected 100 pages from Book 1
were found to have 25 principles which were common
to both analyses. In the first analysis only 25
principles were found while in the second, three
additional statement of principles appeared making
a total of 28. Substituting in the formula,
"coefficient of reliability" equals $\frac{A}{A+B+C}$
where $A$ is the number of principles common to both
analysis; $B$ is the number of principles found to
appear only in the list resulting from the first
...
analysis, and $C$ is the number of principles found to appear only in the list of the second analysis the value of $0.893$ was obtained.

Table I, which follows, shows the book number and the total number of books in which the designated principles occurred in the four books analyzed.
The data in Table 1, which follows, show the poor results when the correct number of papers is assigned to groups, leading to an underestimation of accuracy in the data.
## TABLE I

THE NUMBER OF HIGH-SCHOOL TEXTBOOKS OF PHYSICS IN WHICH THE DESIGNATED PRINCIPLES WERE FOUND

</table>

In the past four years, there have been several instances of excessive force being used by law enforcement officers. The situations were as follows:

1. A police officer used excessive force during a traffic stop.
2. A SWAT team's entry into a building resulted in the use of lethal force.
3. An officer used a taser during a domestic dispute.
4. Police used chemicals to disperse a crowd.
5. A police officer used a gun during a chase.

These incidents highlight the need for more training and oversight in the use of force by law enforcement. It is crucial to ensure that officers are properly trained and that there is accountability for any misuse of force. The use of deadly force should be a last resort and only used when absolutely necessary.

**Total**

- The above table shows the results of some test runs with different conditions. The table includes columns for F, G, H, I, and J, with values indicated by 'x' for various scenarios.

The table indicates a trend where certain conditions (F, G, H, I, J) produce specific outcomes, with 'x' marking successful runs.

**Note:**

- The table is part of a larger document discussing experimental results in a scientific context.

---

**Legend:**

- The 'x' markings indicate successful runs under the specified conditions.

---

**Footnotes:**

- Further details on the experimental setup and methodology are provided at the bottom of the page.

---

- The page references a larger body of work, possibly discussing the implications of these findings in a broader scientific context.

**Explanations**

- In the table above, the letters X indicate that the task is performed on that day.
- The tasks are listed for Monday to Friday.
- The table is used to track the completion of daily tasks.

**Notes**

- The tasks include: Daily routine, laundry, grocery shopping, cleaning, and work.
- The tasks are prioritized based on importance.
- The table helps in organizing and managing daily activities efficiently.

- Please note: The table above represents the number of problems in different textbooks for various grades. Each row corresponds to a specific grade level, and the columns indicate the number of problems found in each textbook.
Findings. Under five of the seven topics, Book 2 was found to have fewer statements of principles than any of the other three books. Under the topic Atoms, Atomic Transformation, and Electrical Emission no statements of principles were found. Book 4, on the other hand, yielded totals for five of the seven topical groupings higher than any of the other three books. Book 1 was found to have the greatest number of principles under the topic Mechanics of Fluid and Solids.

In the average number of principles for the four books 2.5 was found under the topical heading Matter and Molecules as one extreme, and 32.3 under Mechanics of Fluids and Solids as the other extreme.

Table III, which follows, gives the total number of principles and the percent of the total found for each of the four books. The average number of principles and the average percent of the number of principles.
The page contains a typewritten paragraph. The text is not legible due to the quality of the image. The paragraph discusses some philosophical or educational topic, but the content is not clear enough to be transcribed accurately. The paragraph starts with a sentence about life and its implications, followed by a discussion that seems to be about education or knowledge. The text appears to be from a book or an essay, given the formal style and the structure of the paragraph.

*Table III is read thus: Of the total number of 147 different principles found in all four books, 110 or 75 percent were found in Book 1, 72 or 49 percent in Book 2, etc., for an average of 102.5 per book, or an average of 70 percent of the total 147 principles.

**Findings.** Book 2 was found to have only 72 statements of principles of the 147 found in all four books. This number expressed in percent of the total is only 49.

Book 4 had 118 statements which conformed adequately to the criteria of a statement of principle, or 81 percent of the total.

In terms of averages the total number of principles was 102.5 and the percent was 70.

CHAPTER III

SUMMARY, CONCLUSIONS, AND RECOMMENDATIONS

Statement of the Problem

The problem of this investigation was to select from four textbooks of physics for the senior high-school level, statements which can be justifiably assigned to the principles of physical science compiled by Wise.

SUMMARY OF THE TECHNIQUES EMPLOYED

The assignment of statements of principles found in four physics textbooks was started by first copying the list of principles compiled by Wise on file cards three by five inches. The cards were then grouped under seven topical headings, and placed in pockets that were pasted on the insides of a two-flap file folder eight by eleven inches. An eighth pocket was pasted and used only for those principles which did not apply to physics.

In the page by page analysis of four books, the page number was recorded on the file card when a statement of principle was found. In addition, each statement was underlined in the book it appeared. This method was followed until all the books were completely analyzed.
The problem of high immobilization may be solved by forming Larger cores of prismatic blocks on the pillars. The amount of housing may be increased by making a few large columns instead of a number of small ones. The space between the columns and the pillars may be utilized for passage ways and for the storage of machinery and other equipment.
SUMMARY OF THE FINDINGS

Book 4 was found to have the greatest number of statements of principles. Of the combined 147 found in all the books, 118 or 81 percent were found in Book 2. Books 2 and 3 were both found to have 110 or 75 percent of the total.

The average number of principles per book grouped by topics were:

- Matter and Molecules: 2.5
- Mechanics of Fluids and Solids: 32.3
- Sound: 10.1
- Light: 14.2
- Heat: 13.2
- Electricity and Magnetism: 24.0
- Atoms, Atomic Transformation and Electric Emission: 6.0

Lastly, the number of principles per book was 101.

CONCLUSIONS

Since the development of the understanding of principles of physical science is considered by this investigator to be an important factor in teaching a course in physics at the senior high-school level, it seems reasonable to assume that textbook writers should focus their thinking on principles. As borne
**SUMMARY OF THE PRINCIPLES**

The average number of principles per book was 10.

**CONSIDERATIONS**

Since the development of the principles of psychology, it has become necessary to base their instruction on an important factor in teaching and learning. This factor is the earnest desire to assume their textbook character and to make them stand firmly on principles. A point
out by the tables of this investigation, a fairly wide range in thinking exists along these lines. It is encouraging to note, however, that the more recent books contain a larger number of principles than the older ones. The book with a revision date of 1943 had only 49 percent of the total statements of principles found, while the books revised in 1946 yielded 75 and 81 percents.

The topic of Electricity and Magnetism has occupied a larger amount of book space than any of the other six topics in all four books analyzed. The number of principles found under that topic, on the other hand, is an average of 24 per book as compared to 32.3 per book under the topic Mechanics of Fluids and Solids. The importance of the topic has been recognized, but the number and kind of principles seem apparently to be regarded as unimportant.

RECOMMENDATIONS

Textbooks in physics for the senior high school should be written to help in the development of the understanding of the principles given in Wise's list. They should likewise be organized to incorporate important applications of these principles.

Those people who are now writing textbooks in physics or contemplate doing so should include or
This article is intended to provide an overview of the current state of the field of...
plan to include sufficient materials to develop adequately the principles given in Wise's list. If the problem of book space is encountered it is recommended that those principles which are given at the top of the list be first considered.

After a period of about five years from today, a study similar to this one should be undertaken to determine whether physics textbook writers have included more principles in their books than those analyzed for this investigation. It is hoped that such an investigation will show a greater number than found by this one.

Since the possibility exists that five years from now Wise's list of principles may need additions it is, therefore, further recommended that a study similar to that of Wise be conducted so that the "Master" list of principle is up-to-date.
After a period of sport live games from today

With the arrival of new data and analysis, it appears that some principles in game design can still be applied to our investigation. It is hoped that our findings will provide a clearer understanding and insight into the complexities of sport live games

Since the possibility exists that live games

This new aspect of intuition was never before considered in the

Aspects that were once only considered in theory are now part of the game.
