# SET RESEARCH FREE

## With Open Access

---

***Open Access is free, unrestricted access on the Internet to the same type of high-quality, peer-reviewed scholarship that is available by subscription. Authors can make their articles openly accessible by publishing in an open-access journal or posting copies of their articles on an open Web site or repository after they've been published in a traditional journal.***

---

You're not able to access some of the articles you want to read online because many scholarly journals are available only to subscribers. Journal subscriptions — especially in science, technology, and medicine — can cost thousands of dollars each year, and some cost more than \$20,000.

Your library pays for many of these subscriptions (with support in part from your tuition) and some universities actually spend millions of dollars annually on journals — but they still can't afford access to everything their students and faculty need.

There's an alternative to the closed, subscription access model: Open Access.

With Open Access, the costs of publishing an article are covered by other sources — with sponsorships, publication fees, advertising, or a wide variety of possible combinations — so that everyone in the world can read the latest research online without paying an access fee. That's why so many researchers, libraries, and universities support Open Access, and why more authors and journals continue to make the switch.

Students — who read, rely on, and write for scholarly publications — have the power to change the way research is exchanged.

---

### SCHOOLWORK IS EASIER

It's a familiar story: You're writing a paper for class and you need to cite articles from peer-reviewed journals. Eventually, you find an article that looks good — maybe via a search engine, a footnote from another source, or a reference in an index. You search the Web for the full text, but you can't get past the abstract. You look on your library's Web site but they don't have a subscription. You're stuck. Maybe that article would have been a major source for your work — you'll never know. You don't have access. Open Access changes that. No more worrying about whether you're on the campus network or if your library has a subscription. If you're online, you have access, period — anywhere in the world.

### EVERYONE HAS ACCESS

Open Access isn't just for students and academics. With Open Access, everyone can read the latest research. Think of how important that could be to:

- A patient looking for information on a treatment his or her doctor has ordered or on a trial of a drug that could treat a disease...
- A small business startup researching the latest related technological developments...
- Any one of us interested in better understanding global warming...

Just as the Internet has democratized information, Open Access will promote sharing knowledge for the public good. Any subject you might think of — anything at all — you can look it up on Google or Yahoo! and learn about it. Open Access adds a massive inventory of reliable, scholarly sources to that free global library — quality ensured by the process of peer review.
